

Setting up Geometrixx

Step 1: Create an account at a hosting site

There is not a specific host that you need to use but some that will work are:

[000Webhost](#) (free)

[Godaddy](#) (free trial)

[Bluehost](#)

[Hostgator](#)

[Justhost](#)

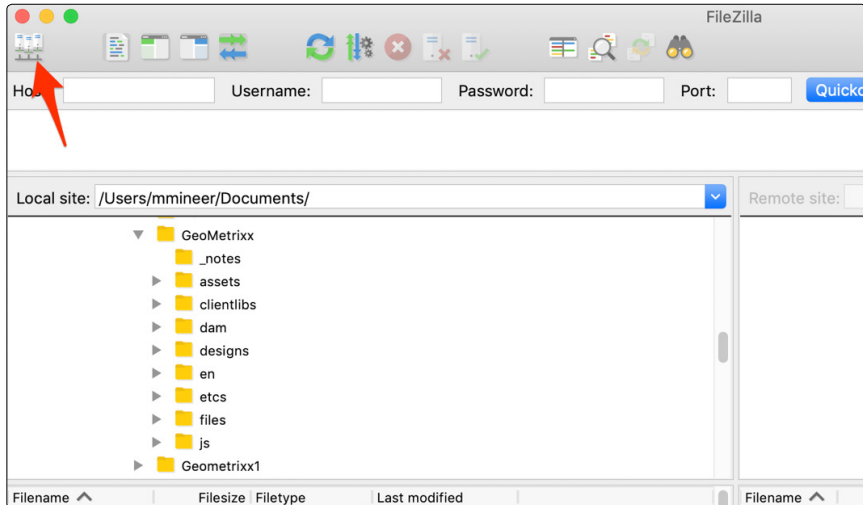

NOTE: There are literally hundreds of hosting options and most of them will work. The list above is just to provide some guidance if needed.

Step 2: sFTP Instructions

Once you have gone through the initial setup, you can configure your FTP client to connect to the hosting account. These instructions are specific to FileZilla and different programs will have slightly different steps.

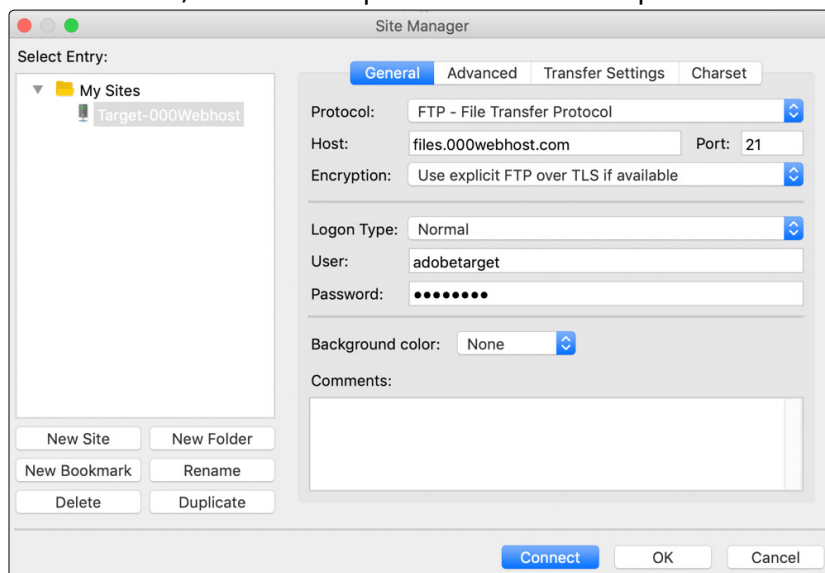

Download and Install an FTP client (e.g. FileZilla).

1. Open your FTP client.
2. Click on File > Site Manager

3. Click New Site
4. Enter the following information
 - > Protocol: FTP – File Transfer Protocol
 - > Hostname: files.000websot.com
 - > Port: 21
 - > Encryption: Use explicit FTP over TLS if available
 - > Logon Type: Normal
 - > Username: (your login for your host)
 - > Password: (your password for your host login)

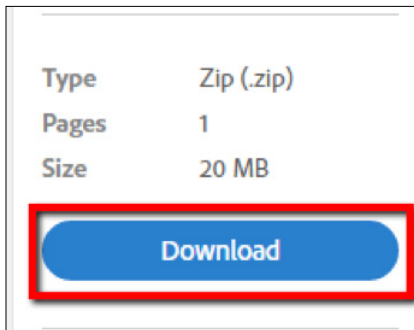

Notice the red; those are the pieces that will be unique to each individual

That's it! You should now be able to FTP directly to your hosting account. Be sure to confirm your website directory structure within your host and match it within the FTP server.

Step 3: Download the zip file

1. Click [here](#) to download the file
 - a. Click on the download button

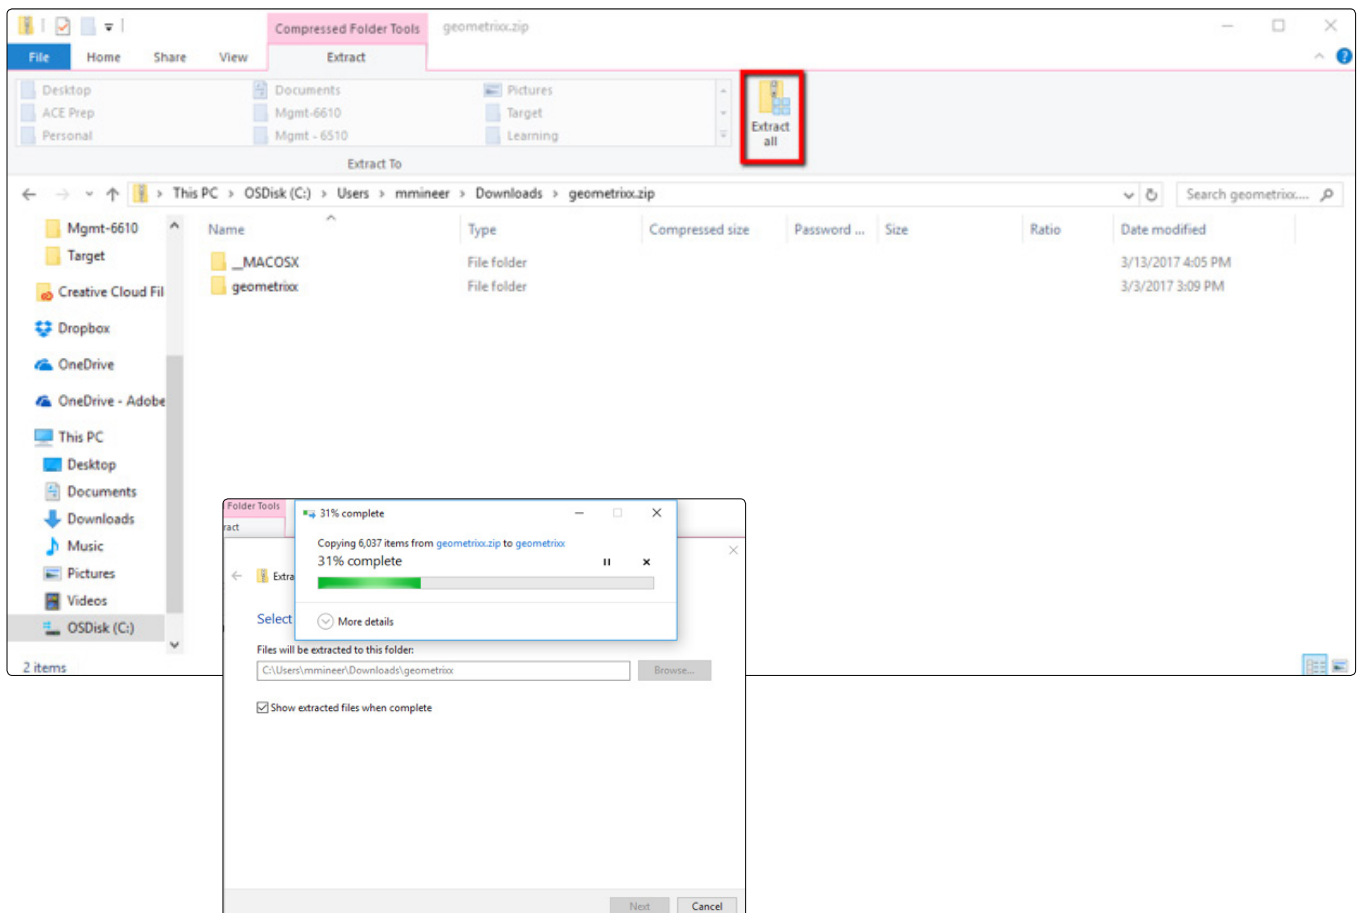

b. Alternatively, access the direct link: <https://files.adobe.com/a/preview/4ad01dbb-5125-4c4d-8005-4ee8b1953386>

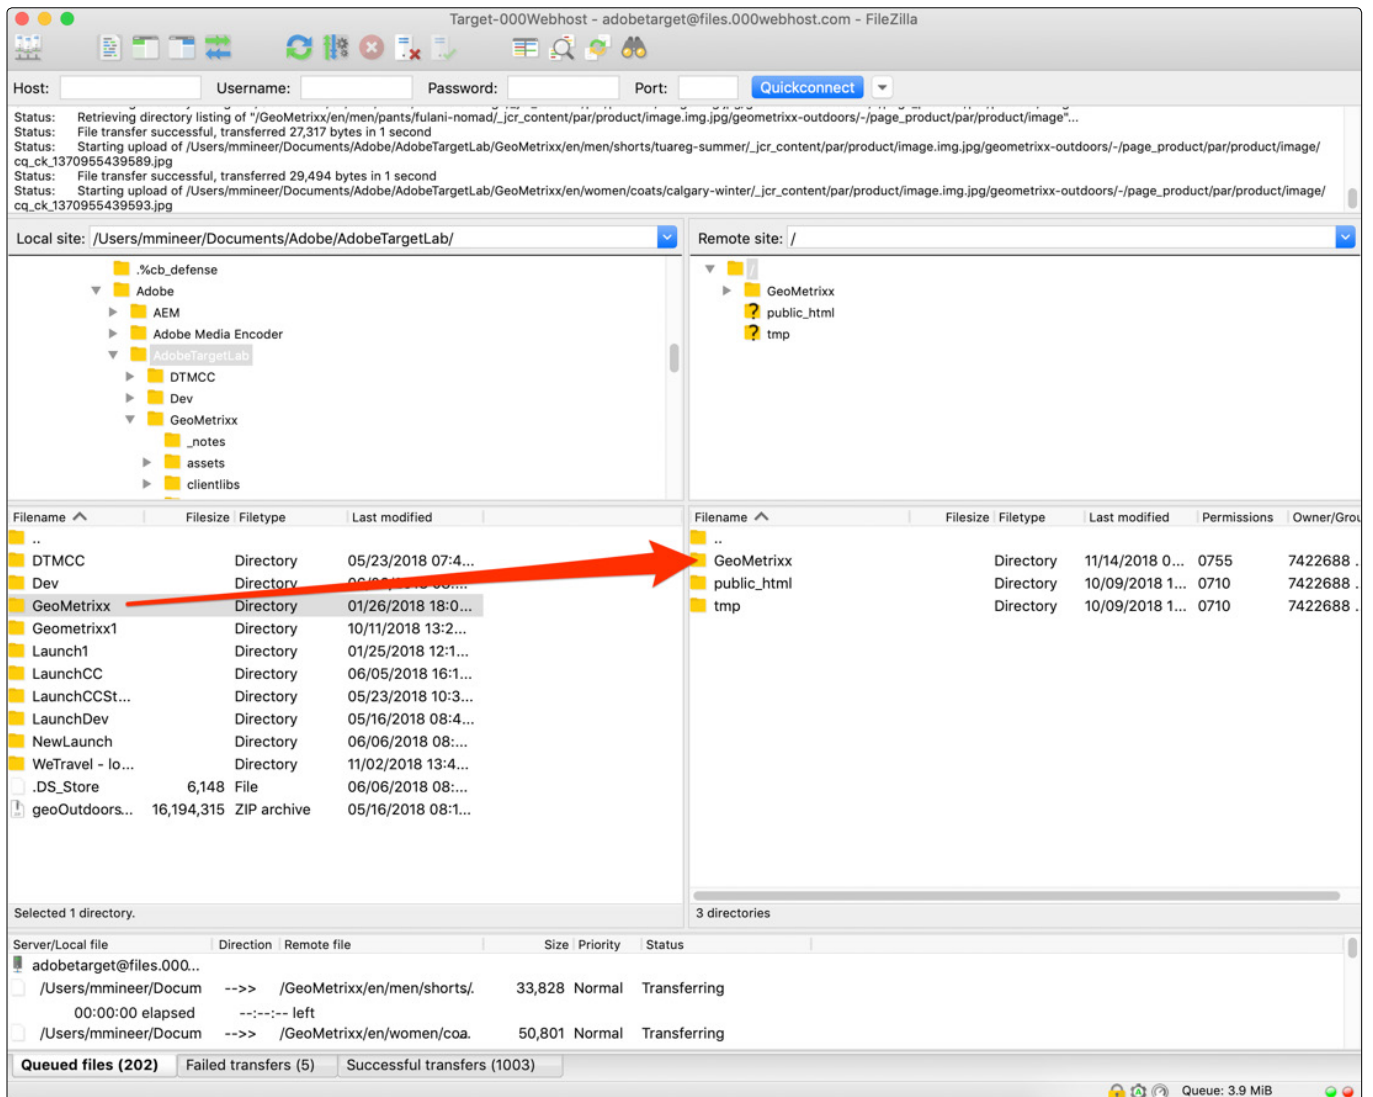

2. Remember the location where you downloaded the file

Step 4: Extract contents and upload via FTP

1. Delete all files from the directory that already exist (This isn't required)
 - › Please note that you will not be allowed to delete all files but those that remain will not affect you.
2. Extract the file(s).

3. Upload the files to the FTP directory from step 2. The site is designed to run from a folder. The folder name should be geometrixx. The site should be placed in a folder that is in the root directory.

Step 5: Validate the site is working

This is done by going to the URL of your site and adding /geometrixx/ (this should match the name of your folder from above) to the end of the URL.
